

If we consider the Voltage change starting at Point P and going all the way around the circuit loop back to Point P, what is the grand total  $\Delta V$ ?

- A.  $\Delta V = +6.0$  Volts
- B.  $\Delta V = +12$  Volts
- C.  $\Delta V = +18$  Volts
- D.  $\Delta V = 0.0$  Volts
- E. Something different!!

As you walk past the two circuit elements shown, moving FROM a TO b, what is  $\Delta V$  in each situation?

	Situation #1	Situation #2
	You walk this way, a to b	
A)	+V,	+I R
B)	-V,	+IR
C)	+V,	-IR
D)	-V,	-IR

The current directions have been *guessed* as shown. Which is the correct current equation for this circuit?

- A)  $I_2 = I_1 + I_3$     B)  $I_1 = I_2 + I_3$     C)  $I_3 = I_1 + I_2$

What is the correct voltage equation for loop 1?

- A)  $-I_2 R_2 - V_2 - I_1 R_1 = 0$     B)  $-I_2 R_2 - V_2 + I_1 R_1 = 0$   
 C)  $+I_2 R_2 + V_2 - I_1 R_1 = 0$     D)  $+I_2 R_2 + V_2 + I_1 R_1 = 0$

©University of Colorado, Boulder (2008)

- C: A changes, B changes
- D: A changes, B stays same

*Facts about bar magnets:*

- 1) North poles attract to South poles (opposites attract)
- 2) B field lines point from "N" to "S"
- 3) Compass needles are little magnets. (They point in the same direction as **B**-field)

The arrow (tip) of the compass needle must be... A: North B: South

©University of Colorado, Boulder (2008)

Compass needles point roughly towards the earth's geographic North Pole. Earth can be viewed as having a giant dipole magnet embedded in it

From this, which can you conclude?...

A: Geographic North = magnetic North Pole of earth

B: Geographic North = magnetic South Pole of earth

A permanent bar magnet is broken in half. Do the pieces attract or repel?

A: Attract

B: Repel

C: Neither, no net force!

©University of Colorado, Boulder (2008)

A permanent bar magnet is broken in half.  
The two pieces are interchanged, keeping  
their orientations fixed, as shown below.  
Do the pieces attract or repel?

A: Attract

B: Repel

C: Neither,

no net force!
