

A transformer is attached to a battery and a resistor as shown. In "steady state", the voltage difference across the resistor R is ...

- A:  $V$       B:  $V N_1/N_2$       C:  $V N_2/N_1$   
 D:  $0$       E: Other

The primary coil of a transformer is connected to a battery, a resistor, and a switch. The secondary coil is connected to an ammeter. When the switch is closed, the ammeter shows...

- A:  $I=0$       B:  $I \neq 0$ , for a brief instant  
 C: steady  $I \neq 0$  after switch closed

Transformer

If there are 4 primary coils and 40 secondary coils, what can you say about “power out” ( $V_{out} * I_{out}$ ) compared to “power in” ( $V_{in} * I_{in}$ ) (for AC input)

- A) About the same
- B) Power out will be 10x greater
- C) Power out will be 10x smaller
- D) Something else!

A step-down transformer is attached to an AC voltage source and a resistor. How does  $I_S$  compare to the current that is drawn from the AC source  $I(in)$

- A)  $I_S > I(input)$
- B)  $I_S < I(input)$
- C)  $I_S = I(input)$

Excel wants to reduce the energy wasted during power transmission from the plant to Boulder.

$P_o = iV$  of the plant is 300 MW.

If they double Voltage  $V$ , by what factor does the power lost in the cable ( $P_{lost} = i^2 R_{cable}$ ) decrease?

A: No decrease B: 2x C: 4x D: 8x

A row of + charges is fixed on the ground.  
A person with a gauss-meter runs *right* along (in front of) the row of charges.

What is the direction of the B-field the observer measures?

How do you generate light  
(electromagnetic radiation)?

- A) Stationary charges
- B) Charges moving at a constant velocity
- C) Accelerating charges
- D) b and c
- E) a, b, and c

$c=3E8$  m/s

VERY roughly, how far away is  
one "light second"?

- A) Here to New York City
- B) Here to the moon
- C) Here to the nearest star
- D) (?? A "light second" is not a  
*distance?*)
