$$V(r, \theta) = \sum_{l=0}^{\infty} \left( A_l r^l + \frac{B_l}{r^{l+1}} \right) P_l(\cos \theta)$$

V everywhere on a spherical shell is a given constant, i.e.  $V(R, \theta) = V_0$ .

There are no charges inside the sphere.

Which terms do you expect to appear when finding  $V(\text{inside})$  ?

- A) Many  $A_l$  terms (but no  $B_l$ 's)
- B) Many  $B_l$  terms (but no  $A_l$ 's)
- C) Just  $A_0$
- D) Just  $B_0$
- E) Something else!

Hint:

V must be finite everywhere.

### Orthogonality

$$\int_{-1}^1 P_l(x) P_m(x) dx = \begin{cases} \frac{2}{2l+1} & \text{if } l = m \\ 0 & \text{if } l \neq m \end{cases}$$

With:  $x = \cos \theta$  and:  $dx = -\sin \theta d\theta$ , we get:

$$\int_0^\pi P_l(\cos \theta) P_m(\cos \theta) \sin \theta d\theta = \begin{cases} \frac{2}{2l+1} & \text{if } l = m \\ 0 & \text{if } l \neq m \end{cases}$$

---

---

---

---

---

---

---

---

3.17

Given  $V_0(\theta) = \sum_l C_l P_l(\cos(\theta))$  we want to get to

$$\text{the integral: } \int_{-1}^1 P_l(u) P_m(u) du = \begin{cases} \frac{2}{2l+1}, l=m \\ 0, l \neq m \end{cases}$$

we can do this by multiplying both sides by:

- A)  $P_m(\cos\theta)$
- B)  $P_m(\sin\theta)$
- C)  $P_m(\cos\theta) \sin\theta$
- D)  $P_m(\sin\theta) \cos\theta$
- E)  $P_m(\sin\theta) \sin\theta$

b

$$V(r, \theta) = \sum_{l=0}^{\infty} \left( A_l r^l + \frac{B_l}{r^{l+1}} \right) P_l(\cos\theta)$$

Suppose  $V$  on a spherical shell is constant, i.e.  $V(R, \theta) = V_0$ .  
Which terms do you expect to appear when finding  $V(\text{inside})$  ?

- A) Many  $A_l$  terms (but no  $B_l$ 's)
- B) Many  $B_l$  terms (but no  $A_l$ 's)
- C) Just  $A_0$
- D) Just  $B_0$
- E) Something else!

Hints:

$V$  must be finite everywhere.

$P_0(\cos\theta) = 1$   
 $P_1(\cos\theta) = \cos\theta$   
 $P_2(\cos\theta) = 3/2 \cos^2\theta - 1/2$   
 Etc.  
 - Legendre Polynomials are orthogonal

$$V(r, \theta) = \sum_{l=0}^{\infty} \left( A_l r^l + \frac{B_l}{r^{l+1}} \right) P_l(\cos\theta)$$

Suppose  $V$  on a spherical shell is constant, i.e.  $V(R, \theta) = V_0$ .  
Which terms do you expect to appear when finding  $V(\text{outside})$  ?

- A) Many  $A_l$  terms (but no  $B_l$ 's)
- B) Many  $B_l$  terms (but no  $A_l$ 's)
- C) Just  $A_0$
- D) Just  $B_0$
- E) Something else!!

3.19a

$$P_0(\cos\theta) = 1, \quad P_1(\cos\theta) = \cos\theta$$

$$P_2(\cos\theta) = \frac{3}{2}\cos^2\theta - \frac{1}{2}, \quad P_3(\cos\theta) = \frac{5}{2}\cos^3\theta - \frac{3}{2}\cos\theta$$

Can you write the function  $V_0(1 + \cos^2\theta)$  as a sum of Legendre Polynomials?

$$V_0(1 + \cos^2\theta) = \sum_{l=0}^{\infty} C_l P_l(\cos\theta)$$

- A) No, it cannot be done  
 B) It would require an infinite sum of terms  
 C) It would only involve  $P_2$   
 D) It would involve all three of  $P_0$ ,  $P_1$  AND  $P_2$   
 E) Something else/none of the above

MD11-2  $\nabla^2 V = 0$

Suppose that applying boundary conditions to Laplace's equation leads to an equation of the form:

$$\sum_{l=0}^{\infty} C_l P_l(\cos\theta) = 4 + 3\cos\theta \quad (x = \cos\theta)$$

$P_0(x) = 1$

$P_1(x) = x$

$P_2(x) = (3x^2 - 1)/2$

Can you solve for the coefficients, the  $C_l$ 's ?

A) No, you need at least one more equation to solve for any the  $C$ 's.

B) Yes, you have enough info to solve for all of the  $C$ 's

C) Partially. Can solve for  $C_0$  and  $C_1$ , but cannot solve for the other  $C$ 's.

D) Partially. Can solve for  $C_0$ , but cannot solve for the other  $C$ 's.
